

Osteologia & Histologia

The femur is the longest bone of the corpus humanum. The musculus quadriceps femoris inserts via the tendon. Note the trabeculae of the os femoris and the relationship of the nervus ischiadicus to the bone. Histological sections reveal osteocytes within lacunae (see Figure 1).

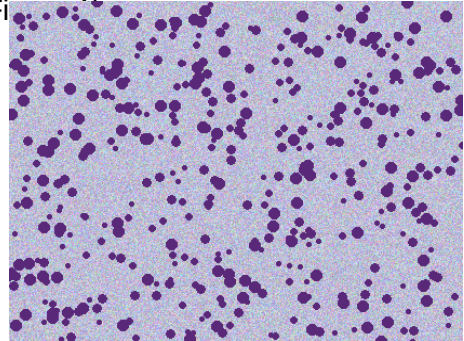

Figure 1: Femur histology (osteocytes)

The cranium protects the encephalon. The arteria carotis interna supplies blood. Figure 2 shows a schematic of the vertebra and its foramen, with the medulla spinalis passing through the canalis.
